

Your request	Our response	Change made
Case 4 - 329.010.00279 (imipramine)	You will see that we had already changed the classification from 'Suicidal ideation' to '? Suicidal ideation' in the most recent draft of Appendix 3 that you received on 27 July. We stand by our coders decision to not exclude the possibility that this could have been suicidal.	Already addressed
Case missing – 329.003.00089 (paroxetine)	This had already been added in the revised version that was sent on 27 July	Already addressed
Case 5 event 2 should say day 73 based on appendix D and G (also noted by the authors in their notes) but in the "day AE occurred" column states 35 which is incorrect.	We can find no typo here, but happy to correct at proof stage if there is one.	
Case 8 should say 329.001.00065	Thank you	Done
If you agree with the points our reviewer picked up on, we would like you to explain her assistance in the methods section of the paper.	Your carrying out a check on Appendix 3 does not constitute part of the RIAT methodology, so it would not be appropriate to include it in our methods section.	We do not think the checkers contribution was as great as some other reviewers, for example Dr Doshi. We will be happy for all reviewers to be acknowledged, and we propose that you make an editorial note about the extraordinary number and involvement of reviewers in this paper.
